Montgomery's 911 troubles appear widespread

At least three Maryland counties report glitch; problem could be nationwide

by Erin Cunningham and Andrew Ujfusa | Staff Writers

Recently, the industry has observed some heavy call volumes that can result in *Wink Failures* of Selective Router (SR) to Public Safety Answering Point (PSAP) Centralized Automatic Message Accounting (CAMA)² trunks. These trunks transmit the caller's Automatic Number Identification (ANI) using Multi-Frequency (MF) digits based upon CAMA signaling standards. CAMA trunk technology, which was originally designed to provide a method for delivering the calling (originating) number from End Office to Toll Office, has widespread support across many platforms within the industry and has proven to be a highly reliable 9-1-1 standard. In the 9-1-1 context, the ANI digits that identify the 9-1-1 caller are relayed across the CAMA trunk to the PSAP. CAMA trunks utilize in-band signaling for call setup and, if the call setup is not successful due to a signaling failure, the SR can remove the CAMA trunk from service.

David Rotenstein stands by a fence near his Silver Spring home that was nearly ignited Jan. 26 when a downed power line sparked a small fire in the grass. He and his neighbors were unable to reach 911 to report the emergency.

PUBLIC SAFETY CHALLENGES

Some public safety challenges

- Telephony denial-of-service attacks
- Transition in user behaviors and home capabilities
- Emergency alerting
 - good for “seek shelter now”
 - not so great for multi-day informational outreach
 - Sandy: “where can I find gas?” “which roads are passable?”
- Redundancy that isn’t
 - small number of selective routers or SIP proxies
- One “911” app per PSAP
 - innovate around slow 911 tech evolution
 - but fragmentation
- Indoor location determination

1 **DHS Warns of ‘TDos’ Extortion Attacks on Public Emergency Networks**

APR 13

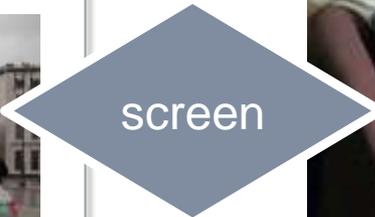

As if emergency responders weren’t already overloaded: Increasingly, extortionists are launching debilitating attacks designed to overwhelm the telephone networks of emergency communications centers and personnel, according to a confidential alert jointly issued by the **Department of Homeland Security** and the **FBI**.

The alert, a copy of which was obtained by KrebsOnSecurity, warns **public safety answering points (PSAPs)**

OPPORTUNITIES

Opportunities

- Better indoor location
- More efficient operation
 - scale technology separately from call taking & first responders
 - human-human → human-machine & machine-machine
 - information filtering, routing and prioritization
 - building sensor integration (e.g., alarm panels, cameras)
- Simplified citizen interaction interface
- Improving monitoring & statistics
- 911: one-way, inbound only → include information dissemination

Indoor location

- 70% (est.) of wireless calls indoors
- GPS generally only works in woodframe single-family homes or near windows
- Does not provide floor or apartment/cubicle
- “Can deliver cronut coupons to within 10’, but not EMTs to the right store”
- → Integrate multiple location technologies
 - rough for routing, backup and spoofing prevention
 - fine-grained for dispatch
 - not all technologies all the time
 - consider building infrastructure

Improving monitoring & statistics

- Old model:
 - largely local facilities & monitoring
 - limited on-going location accuracy testing
 - limited analysis
- Opportunity:
 - state-wide or regional network operations center
 - remote recovery
 - statistics
 - response time components
 - nature of calls
 - location accuracy

Integration of emergency handling into day-to-day operations

- Larger roles for fire marshals
 - location accuracy testing
 - 911 dialability in hotels & other semi-public buildings
- Integration of “commercial” technologies and emergency handling
 - e.g., use ad networks for delivering emergency
- Using delivery vehicles for location accuracy testing
- Is there a clear boundary between 311, 911 and information dissemination?
 - public safety as information hub

Conclusion

- Convergence: all services are IP, just with different physical layers
 - but transitions are slow
- Old assumptions no longer hold
 - home devices
 - citizen assumptions
- Bypass and innovate-around
- Opportunities for both better service & lower cost
