# FEDERAL COMMUNICATIONS COMMISSION <br> MASS MEDIA BUREAU <br> POLICY AND RULES DIVISION <br> WASHINGTON, D.C. 20554 

## REVIEW OF THE RADIO INDUSTRY, 2001

September 2001

## EXECUTIVE SUMMARY

On February 8, 1996, President Clinton signed into law the Telecommunications Act of 1996. Section 202 of the 1996 Act eliminated limits the FCC had previously placed on the number of radio stations a single entity could own nationally. It also significantly relaxed limits the FCC had placed on ownership of radio stations in a local market. On March 7, 1996, the FCC implemented these provisions of the 1996 Telecom Act by revising Section 73.3555 of our Rules (47 C.F.R. §73.3555) to eliminate the national multiple radio ownership rule and relax the local ownership rule.

In March 1998 and January 2001, the Mass Media Bureau Policy and Rules Division released the previous Reviews of the Radio Industry examining changes in various aspects of the commercial broadcast radio industry as a result of the implementation of these provisions of the Telecom Act. These reports indicated a trend toward consolidation of radio station ownership resulting in fewer owners at both the national and local levels. This report provides an update of the impact of the Telecom Act through March 2001.

Overall, there has been an increase in the number of commercial radio stations of 7.1 percent between March 1996 and March 2001. The number of radio owners declined by 25 percent during this five-year period. This decline is primarily due to mergers between existing owners. Over the same period, there has also been an increase in the size of the largest radio group owners. In 1996, the two largest radio group owners consisted of fewer than 65 radio stations each. In March 2000, the two largest radio group owners consisted of more than 440 radio stations each. In August 2000, the two largest radio groups merged, so that now Clear Channel Communications owns approximately 1,000 radio stations, with pending acquisitions before the Commission for over 200 additional stations. The second largest group owner, Cumulus Broadcasting Inc, has approximately 250 stations.

At the local level, there continues to be a downward trend in the number of radio station owners in Arbitron Metro markets. Further, the top owners in each Metro market generally account for an increasing share of the total radio advertising revenues in these markets. The largest firm in each radio Metro market has, on average, 46 percent of the market's total radio advertising revenue. The largest two firms in each radio market have, on average, 73 percent of
the market's radio advertising revenue. Overall, the variety of radio formats available to consumers had held steady. However, in recent years the average number of formats appears to have declined slightly for some of the large markets while increasing slightly for most of the smaller ones.

Most of the financial-market trends reported in previous Radio Reviews continue to hold through 2000. Our analysis of publicly-traded companies whose primary business is radio broadcasting continues to reflect strong earnings. Publicly-traded radio companies, however, still carry heavy debt loads, which contributes to the high volatility observed in their earnings. Also, the high debt loads of these publicly-traded radio companies also contribute to the volatility of their stock market valuations. Finally, except for the year 2000, the valuations of these radio companies have outperformed the broad market of publicly-traded companies, as reflected in Standard and Poor's 500 (S\&P 500) index returns.

## 1. Overview

In an Order adopted March 7, 1996, the Commission implemented the provisions of the Telecom Act of 1996 directing it to revise its rules concerning national multiple as well as local radio ownership. These provisions first required that the Commission eliminate its national ownership rule that limited the number of AM and FM stations one entity could own or control on a nationwide basis to no more than 20 AM or 20 FM stations. The provision that permitted an entity to own an additional 3 AM and 3 FM stations if they were small business-controlled or minority-controlled was also eliminated. Next, these provisions required that the Commission relax its local ownership rules such that:
a. In a radio market with 45 or more commercial radio stations, an entity would be allowed to own, operate, or control up to 8 with not more than 5 in the same service;
b. In a radio market with between 30 and 44 commercial radio stations, an entity would be allowed to own, operate, or control up to 7 with not more than 4 in the same service;
c. In a radio market with between 15 and 29 commercial radio stations, an entity would be allowed to own, operate, or control up to 6 with not more than 4 in the same service;
d. In a radio market with 14 or fewer commercial radio stations, an entity would be allowed to own, operate, or control up to 5 with not more than 3 in the same service, subject to the limitation that no entity be allowed to own, operate, or control more than $50 \%$ of the stations in these markets.

In March 1998 and January 2001, the Mass Media Bureau Policy and Rules Division released the Radio Review examining changes in various aspects of the commercial broadcast radio industry as a result of implementing these provisions of the Telecom Act. The reports indicated a trend in the consolidation of radio station ownership resulting in fewer owners at both the national and local levels.

This report is an update of the impact of the Telecom Act on the commercial broadcast radio industry through March 2001. The first part, reported in Section 2, examines changes in the radio industry from a national viewpoint, i.e., broad changes to the radio industry focusing on the number of owners and the number of stations held by the largest group owners. Next, Section 3 examines changes in the radio industry at the local level, specifically examining
various indicia of diversity and concentration in each of the areas that Arbitron identifies as a local radio market. Finally, Section 4 compares the financial performance of several publiclytraded radio companies to firms in the S\&P 500.

## 2. Changes in the Radio Industry - A National View

The trends in the radio industry continue through March 2001. Before discussing the specific changes, however, it is necessary to spell out certain assumptions used in the analysis. This report uses the BIA MasterAccess Database of radio stations. BIA regularly updates its database and continues to improve the data it reports. To improve comparability amongst the various time periods, certain changes were made in the March 1996, November 1997 and November 1998, and March 2000 databases. In order to make the March 2001 data comparable with the previous years' data, the following changes were made.

First, BIA presents the ownership data to reflect "pending" or "proposed" transactions. This means that when company " A " announces that it will purchase company " B ", the owner of company B's radio stations are identified as "A." If the proposed transaction does not eventually occur, either in whole or in part, BIA then readjusts the ownership data. In describing the radio mergers, it makes more sense to document the effect of only those mergers that have been completed. Therefore, ownership data from BIA were corrected so that it reflects only mergers that have been completed. ${ }^{1}$ Second, BIA identifies the owners of stations subject to a local marketing agreement (LMA) separately. Since the Commission's rules generally attribute an ownership interest to the brokering station, the BIA data were adjusted so that the ownership of stations subject to an LMA are attributed to the owner with the larger national revenues.

Third, in previous databases there had been a format category "News/Sports" which, in the March 2000 database, was split into two separate categories: "News" and "Sports". To maintain compatibility, each "News" or "Sports" entry was replaced by "News/Sports". Fourth, we note that the number of markets has increased again, from 276 in March 2000 to 283 in March 2001, yet the percentage of stations assigned to markets has

[^0]remained at 57 percent. ${ }^{2}$
Finally, BIA estimates revenue data annually for approximately 45 percent of the radio stations. Most of the radio stations with missing revenue estimates are not assigned to Metro markets and are, therefore, not included in the analysis. The radio stations with missing revenue estimates that are assigned to Metro markets are usually the low-rated stations in the market, and they earn a small share of the market's advertising revenues. In order to include these stations in the analysis, zero values were assigned to the missing data.

With the above caveats in mind, the analysis of the radio industry follows. The number of commercial radio stations has increased about 7.1 percent since March 1996. As of March 2001, there were 10,983 commercial radio stations in the United States. ${ }^{3}$ Of these, about 56 percent $(6,158)$ are FM stations and 44 percent $(4,825)$ are AM stations. While the number of radio stations has grown, the number of radio owners has declined by 6.7 percent from March 1996 to November 1997 (from 5,133 to 4,788 owners), by an additional 5.8 percent from November 1997 to November 1998 (from 4,788 to 4,512), by another 11.2 percent from November 1998 to March 2000 (from 4,512 to 4,006), and by 4.2 percent from March 2000 to March 2001 (from 4,006 to 3,836). As of March 2001, there were 3,836 owners of commercial radio stations across the nation, for a cumulative decline in the number of owners of 25 percent since March 1996.

The decline in the number of owners reflects a general continuation of the consolidation of the commercial radio industry that has occurred since the passage of the Telecom Act in 1996. In each of the last 5 years, about 20 percent of radio stations have changed hands. As a result of this trading activity, there are now 46 radio station owners with 20 or more stations, compared to 25 in March $1996 .^{4}$ Further, there continue to be changes in the composition of the top 50 radio

[^1]group owners, generally reflecting mergers between companies that were previously among the top 50 radio owners. ${ }^{5}$ Also, the two largest radio group owners in 1996 consisted of fewer than 65 radio stations each. As of March 2001, the two largest radio group owners consisted of 972 and 257 radio stations, while the third, fourth and fifth largest held 210, 185, and 97, respectively. ${ }^{6}$ Thus, the decline in the number of owners of radio stations nationally reflects mergers or acquisitions between existing owners that has resulted in larger radio group owners and more group-owned stations.

## 3. Changes in the Radio Industry - A Local View

This report now focuses on changes in the radio industry reflected in data at the Arbitron Metro level. Arbitron, a nationally recognized radio audience research firm, has delineated 283 different local geographic areas, or Metros, to reflect the audiences reached by local radio stations. ${ }^{7}$ Arbitron Metros generally correspond to Metropolitan Statistical Areas as defined by the U.S. Government. ${ }^{8}$ About 57 percent of all commercial radio stations are licensed to communities in the 283 markets. The 283 radio markets consist of more than 900 counties, representing more than one-fourth of all counties in the U.S, plus Puerto Rico. ${ }^{9}$ More than threefourths of the U.S. population of at least 12 years of age resides in the 283 radio markets. ${ }^{10}$ This

[^2]delineation of a local radio market, as defined by Arbitron, is widely used by buyers and sellers of radio advertising and generally reflects market data as determined by surveys of listeners.

All figures displayed in the associated charts represent "smooth" lines rather than the actual data. Smoothing is a statistical technique used to illustrate or reveal trends in the data. A line representing the actual data would be filled with jagged ups and downs, much like the representation of an earthquake on a seismograph. Such a representation would make it extremely difficult to discern a trend in the data. On the other hand, a smooth line uses averaging to blunt the jagged ups and downs of the actual data and to reveal any underlying trends. A point on a smooth line represents a weighted average of the actual data in an interval around that point. ${ }^{11}$ The difference in the lines represents general changes in the radio industry. Because the points on the lines are averages, the reader should not attempt to use these figures to make specific market to market comparisons.

### 3.1 Changes in the Revenue Share Earned by the Metro's Top Owners

Chart I depicts the current state of concentration in the industry, showing the one-firm (CR1), two-firm (CR2) and four-firm (CR4) concentration ratios. ${ }^{12}$ The concentration ratios used in this report are the percentage of market revenue held by the firm(s) in the market (one, two, or four) with the largest revenue. This measure of market concentration is frequently used because

[^3]of its ease of calculation and interpretation. ${ }^{13}$ The smoothed lines reveal the extent of concentration in the markets. There is a clear tendency for the smaller markets to be more concentrated, which is not surprising since the smaller markets have fewer stations.

Nonetheless, even the larger markets appear to be somewhat concentrated. In the 50 largest markets, on average the top firm holds 36 percent of market revenue, the second firm holds 25 percent, and firms three and four split the next 26 percent. For the 100 smallest markets, on average the first firm holds 50 percent, the second firm holds 28 percent, and the next two firms split 17 percent. Overall, in 173 of the 283 Arbitron radio markets (over 60 percent of the markets), one entity controls more than 40 percent of the market's total radio advertising revenue, and in 79 of these markets ( 28 percent) the top two entities control more than 80 percent of market revenue.

Historical perspective for the four-firm concentration ratio is provided in Chart II. This trend of fewer owners generally earning a larger percentage of market revenue is further emphasized by looking at the revenue share of the top four owners in the Metro market. The data suggest that this trend has substantially tapered off over time. The large increase in concentration that occurred from March 1996 to November 1998 can be largely attributed to the relaxation of the local radio ownership rules required by the 1996 Telecom Act, as can the smaller increase that occurred from November 1998 from November 1998 to March 2000. The subsequent change from March 2000 to March 2001 is less pronounced.

### 3.2 Changes in Ownership Diversity

Traditionally, the Commission has been concerned with encouraging diversity in the ownership of broadcast stations so as to foster a diversity of viewpoints in the programming presented over the airwaves. One measure of diversity that is of interest to the Commission is

[^4]the number of independent owners of radio stations in a local Metro market. Chart III depicts changes in the number of owners by Metro market area. This chart reveals that the decline in the number of radio owners nationally reflects a general trend across Metro markets, and not simply consolidations in a few large or small Metro markets. In March 2001, the average number of owners across all Metro markets was 10.3 , with a range of 7.3 in the smallest Metro markets (ranks 101-283) to a high of 25.4 in the "top 10" Metro markets. In March 1996, the average number of owners in a Metro market was about 13.5. Thus, from March 1996 to March 2001, there was a cumulative decline of about 3 in the average number of owners per market. This chart also illustrates that the number of owners declines as the market gets smaller.

### 3.3 Changes in Format Diversity

Another dimension of diversity of concern to the Commission is program diversity. Program diversity is reflected, at least in part, by the number of distinct radio formats available in each Metro market. Chart IV shows the number of distinct radio formats for each Metro market and suggests that there generally continues to be no trend toward change in the diversity of radio programming available to consumers. ${ }^{14}$ The average number of radio formats available in a Metro market has been about 10 since March 1996, with a range of about nine formats in the smallest Metro markets to 16 different formats in the "top 10 " Metro markets. However, while the overall level of formats has held steady, the chart suggests that the number of formats has declined slightly in some of the larger markets while increasing in most of the smaller ones. ${ }^{15}$ Finally, the chart illustrates that the number of formats declines as the market gets smaller.

[^5]
### 3.4 New Developments in Radio Service

Sirius Satellite Radio Inc. and XM Satellite Radio Holdings are building a subscription radio service that will provide national programming, delivering up to 100 channels of digital audio news and entertainment directly from satellites to vehicles, homes, and portable radios in the United States. Each company holds one of the two licenses issued by the FCC to build, launch, and operate a national satellite radio system. Both companies have launched satellites to provide digital radio service. XM Satellite Radio has announced that they will offer satellite radio service in San Diego and Dallas/Fort Worth on September 12, 2001. They plan to expand service to the entire southwest in mid-October, and expect to commence nationwide service in November 2001. ${ }^{16}$ Sirius Satellite Radio expects to commence service in the fourth quarter of 2001. ${ }^{17}$

[^6]

## 4. Radio Industry Financial Performance

This section presents an analysis of the financial performance of the radio industry, with a particular focus on the radio industry's ongoing performance since the passage of the Telecommunications Act of 1996. The financial performance of the radio industry is examined in two ways. First, a comparison over different time periods of the financial performance of the radio industry reveals any changes that might have occurred in the structure of the industry and the conduct of its participants. Second, the financial performance of the radio industry is evaluated to assess its ability to attract new funding to finance its future operations and growth. The following analysis incorporates several financial performance measures that shed light on these two considerations.

Several important assumptions underlie the financial analyses of the radio industry presented in this section. First, the report uses Standard \& Poor's Compustat database to obtain data on publicly-traded companies whose primary SIC code, or industry classification, was radio broadcasting (SIC 4832). ${ }^{18}$ In this way, publicly-traded companies whose revenues are generally derived from their non-radio holdings are excluded from the analysis. Using this criterion, quarterly data are used to calculate financial ratios for 18 large, publicly-traded radio companies, which in total own some 2,215 radio stations and generate more than 66 percent of total reported radio industry revenues. ${ }^{19}$ Thus, most of the companies included in the analysis are larger station-group owners, and therefore may not reflect the performance of smaller owners. Comparable data for companies which are not publicly traded and which would include many of the smaller radio companies are not available through public data sources.

To give perspective to the calculated financial ratios, this report also calculates similar ratios for the S\&P 500 companies. ${ }^{20}$ The median value of the calculated financial ratios for the

[^7]publicly-traded radio companies is then compared to the median value of the same ratios for the S\&P 500 companies. The median is used, rather than the average (arithmetic mean), as a summary statistic, since financial ratios are rarely normally distributed and outliers (i.e., unusually high or low values) could distort the analysis. The S\&P 500 companies are used to create the benchmark financial ratios, since the S\&P 500 is typically thought of as representing the broad "market" of U.S. companies. ${ }^{21}$ Thus, the use of the S\&P 500 companies to create benchmark ratios reflects an effort to create benchmarks based upon a broad swath of publiclytraded companies. ${ }^{22}$

Given these caveats, the analysis of the financial performance of the radio industry follows. This analysis is conducted ratio by ratio, with attention first given to ratios that focus on the operating performance of radio companies (i.e., EBIT margins and net profit margins). Ratios that shed light on the financing of radio companies are then explored (i.e., total debt as a percentage of total capital, fixed charge coverage after taxes, market to book ratio, and stock market returns). All charts appear at the end of this section.

### 4.1 EBIT Margins

The earnings before interest and taxes margin (EBIT Margin) is defined as the ratio of a firm's earnings (before subtracting out interest and taxes) to the firm's total sales. ${ }^{23}$ As such, this ratio reflects how efficiently the firm generates profits from its sales, or alternatively stated, how well the firm minimizes the operating, personnel and administrative costs of its operations, for a given level of sales. The ratio represents the "gross profit margin" of a company, that is, before
of common stocks covering most sectors of the U.S. economy. The performance of the S\&P 500 companies is a good measure of overall stock market performance. It is similar to, but has a broader selection of companies than, the Dow Jones Industrial Average.

[^8][^9]netting interest expenses and taxes. Chart V shows median EBIT margins for the publicly-traded radio companies (black diamonds) and for the S\&P 500 companies (grey squares).

Chart V indicates that the quarterly gross profit margins of the publicly-traded radio broadcast companies have been greater than the gross profit margins of the S\&P 500 companies in 15 out of the last 21 quarters. Also, the gross margins of the radio companies appear to show a strong seasonality, with gross margins generally highest during the second and third quarters of the year. Overall, the gross profit margins of the radio companies have shown very strong performance, in comparison with the S\&P 500 companies, both since the passage of the Telecom Act at the end of the first quarter of 1996, and when the comparison is made with the data available prior to passage of the 1996 Act.

### 4.2 Net Profit Margins

The net profit margin is defined as the ratio of a firm's net income to its sales. Thus, the Net Profit Margin reflects the operating performance of the firm after netting out interest and taxes from the EBIT Margin, as discussed in the previous section. A comparison of Chart V that displays EBIT margins with Chart VI that shows Net Profit Margins suggests that while radio companies are realizing greater gross profits than the typical S\&P 500 company, they are netting less than the benchmark S\&P 500. This relationship could occur because radio companies are either paying more in taxes than other firms are, or they are paying more in interest than other firms (e.g., use more debt to finance operations). To address this question, it is necessary to examine the debt loads of radio companies.

### 4.3 Debt as a Percentage of Total Capital

Debt as a percentage of total capital represents a measure of a firm's debt load. We use the ratio of long-term debt to total capital as this is the typical measure of a firm's relative use of debt capital versus equity capital. ${ }^{24}$ Quarterly data on debt as a percentage of total capital are presented in Chart VII. Chart VII suggests that the publicly-traded radio companies have generally used more debt than the typical S\&P 500 company to finance its operations and

[^10]growth. Therefore, the radio companies' lower net profit margins result, at least in part, from the greater interest expense of these companies, which is then related to the higher debt loads of the radio companies, compared to the debt loads of the S\&P 500 firms. Another effect of the greater debt loads (leverage) is the increase in the volatility of radio-sector earnings compared to the less-leveraged S\&P 500 companies. This increase in volatility can be seen by comparing the variability of the radio-sector median EBIT margin and net profit margin values with those of the S\&P 500 firms in Charts V and VI, respectively. ${ }^{25}$

### 4.4 Fixed Charge Coverage After Taxes

Fixed charge coverage after taxes is a measure of a firm's ability to pay its interest expense (to bondholders and other creditors) out of its net income. This is measured as the ratio of quarterly net income (before extraordinary items) divided by interest expense, from which 1 is subtracted. Therefore, the ratio measures how many times the interest expense is "covered" by the radio company's net income, which provides a sense of the radio company's ability to manage its debt load. As Chart VIII shows, while not generating the same level of net income to interest expense as other companies, the publicly-traded radio companies appear to be generating enough cash flow to meet their interest obligations.

### 4.5 Market to Book Ratio

Other aspects of a company's ability to finance its operations are its prospects for future growth and profitability. The market to book ratio is defined as the ratio of a firm's market value of equity to its book value of equity, which is the accounting value that remains out of a firm's assets after paying off all of the firm's creditors. The market to book ratio is a useful

[^11]measure of the market's assessment of that firm's future prospects. The greater a firm's market to book ratio, the higher the market is assessing that firm's future prospects.

Further, the market to book ratio is a good proxy for a firm's "q" ratio. ${ }^{26}$ The q ratio is defined as the ratio of the market value of the firm's assets to the replacement cost of these assets. Such a ratio has several interpretations. First, high q values signal that such firms are earning economic rents. Thus, it signals profitable investment opportunities within a firm or industry. From this perspective, Chart IX indicates that, until the year 2000, the market placed higher valuations on radio properties and operations than those of other companies, such as those reflected in the S\&P 500 median market-to-book values. Chart IX shows that the market-tobook ratios of the radio companies exceeded those of the $\mathrm{S} \& \mathrm{P} 500$ companies in all 17 quarters before 2000. Although the median market to book ratio for our sample of radio companies has dipped below the median market-to-book ratio for S\&P companies during 2000, it has remained above 1 throughout our time frame, perhaps indicating an imperfect market. ${ }^{27}$ For example, a high $q$ ratio value may reflect the ability of a radio station owner to create a format market for itself, which may lessen competitive pressures, at least until future competition catches up.

### 4.6 Stock Market Returns

Quarterly stock returns of the publicly-traded radio and S\&P 500 companies are calculated by including their cash dividends in the return calculation. ${ }^{28}$ Therefore, the return measure reflects both stock price appreciation and the return of cash in the form of dividends to shareholders. Chart X reports the median quarterly stock returns of the two groups of companies. The chart suggests that, while the typical radio company's returns have varied more than that of the typical S\&P 500 company, radio company stocks have overall outperformed the

[^12]broader market, as reflected in the S\&P 500 median stock returns, until the year 2000. The greater volatility of the radio companies' stock market returns is related to the greater leverage of (greater use of debt by) these companies, as discussed above.

Chart X shows that stock returns for the radio companies declined for all four quarters in year 2000, the only four consecutive declines in the chart. These lower returns undoubtedly depressed the market to book ratio for these quarters as shown in Chart IX. Chart X also shows that for these quarters, radio companies performed poorer than the $\mathrm{S} \& \mathrm{P} 500$. One likely reason for this shift in earnings from previous quarters is the slowing economy. Revenues in radio depend exclusively on advertising, and a firm's willingness to advertise is highly sensitive to how much consumers are buying. Chart XI shows that the percent change in retail sales and food services (adjusted for inflation) declined sharply in the last three quarters of 2000. Thus investors would likely expect overall radio earnings to fall in response to declining growth in consumer spending. According to a recent investor report, growth in radio advertising began to fall in the third quarter of $2000 .{ }^{29}$ An additional factor the report cited was the recent collapse of advertising by dot-com companies. One final source for radio's stock decline may be the slowing of the radio industry's consolidation. As fewer opportunities for increased profit through radio mergers present themselves, investors' decline in demand may have depressed the value of the radio industry's stock.

[^0]:    ${ }^{1}$ In the 1997, 1998, 2000 and 2001 data, BIA identifies which transactions are pending, thus making it possible to reassign the stations to the "previous" owner. However, BIA did not do this in the 1996 data.

[^1]:    ${ }^{2}$ To ensure compatibility amongst different BIA databases, similar changes in previous years have required that the previously "out-of-market" stations be reassigned to markets for preceding years. However, a detailed examination of the current database indicated that such reassignment was not necessary for the present database, though it may be necessary for future databases.
    ${ }^{3}$ The number of noncommercial FM stations increased from 1,828 in March 1996 to 2,140. More detailed information on stations and owners is contained in the appendices. In particular, Appendix A summarizes the changes in actual numbers of stations and owners.
    ${ }^{4}$ See Appendix B.

[^2]:    ${ }^{5}$ See Appendix C.
    ${ }^{6}$ By March 2001, the two largest radio group owners merged, so that now Clear Channel Communications owns 972 radio stations, and the second largest radio group owner, Cumulus Broadcasting, has 257 stations. As mentioned above, the BIA numbers were adjusted for pending owners and LMAs. Prior to adjustment, BIA reports Clear Channel Communications to have 1166 stations as of March 2001. Removing those stations whose ownership changes are still pending yields 954 radio stations. When this number is further adjusted, so that stations with which Clear Channel has an LMA are attributable to Clear Channel, we find Clear Channel Communications has 972 stations.
    ${ }^{7}$ Arbitron Metro markets do not correspond to the Commission's definition of a radio station's market for the purposes of applying the Commission's radio ownership rules. See 47 CFR $\S 73.3555(\mathrm{a})$.
    ${ }^{8}$ The Office of Management and Budget designates and defines MSAs in 55 Fed. Reg., 12154-12160 (1990). Generally, a Metropolitan Statistical Area consists of one or more counties that contain a city of 50,000 or more inhabitants, or contain a Census Bureau-defined urbanized area with a total population of at least 100,000.
    ${ }^{9}$ There are 3,127 counties and independent cities in the U.S. The 913 counties (including portions of counties) and independent cities in the Arbitron Metros make up almost 30 percent of all counties and independent cities in the U.S., plus Puerto Rico.

[^3]:    ${ }^{10}$ Arbitron's 283 markets represent about 78 percent of the U.S. population and Puerto Rico for those at least 12 years of age. Arbitron does not measure radio listening statistics for those under age 12.
    ${ }^{11}$ For market 100 , for example, the smoothed line will show a weighted average of the actual data in markets 90 to 110 . The data from market 100 get the most weight, data from markets 99 and 101 get the next most weight, and so forth. The particular smoothing method employed is called "loess" and is described in William S. Cleveland, The Elements of Graphing Data (Hobart Press, 1994). The specific implementation is from the "loess" command in the statistical package "S-PLUS 2000", with the smoothing parameter set to 0.5 .
    ${ }^{12}$ For the current year, March 2001, the Metro market revenue is equated to the sum of the station revenue for stations assigned ("home") to their Metro market. In previous years, Metro market revenue was used. In some cases the differences between these measures of market revenue were the result of out-of-Metro market stations that earned a share of the Metro market revenue. There were other cases where in-Metro market stations earned a share of their revenue outside of their Metro market. These differences are generally small.

[^4]:    ${ }^{13}$ Market concentration is a function of the number of firms in a market and their respective market shares. Concentration ratios are one of the various measures economists use to estimate market concentration. Market shares may be calculated as the firm(s)'s percent share of revenue, as is done here, or may be calculated as the firm(s)'s percent share of audience or capacity. These measures are also used by the Department of Justice and the Federal Trade Commission as an aid to the interpretation of market data and as an indicator of the likely potential competitive effect of a merger. See, e.g., U.S. Department of Justice and the Federal Trade Commission, Horizontal Merger Guidelines, Revised, April 8, 1997; Carlton and Perloff, Modern Industrial Organization, Carlton and Perloff, $2^{\text {nd }}$ edition, pp. 344-349; and Giles Burgess, The Economics of Regulation and Antitrust, pp. 310-312.

[^5]:    ${ }^{14}$ The data on the number of different types of formats per market are based on information in the BIA Radio Database. BIA obtains specific format information from the radio stations it surveys, sorting their responses into broad format categories. The categories are Adult Contemporary, Album Oriented Rock/Classic Rock, Classical, Contemporary Hit Radio/Top 40, Country, Easy Listening/Beautiful Music, Ethnic, Jazz/New Age, Middle of the Road, Miscellaneous, News/Sports, Nostalgia/Big Band, Oldies, Religion, Rock, Spanish, Talk, Urban, Dark (not on air), No Reported Format.
    ${ }^{15}$ A number of theories and empirical studies on the diversification of formats in the radio industry suggest diversification of formats accompanies industry concentration. For example, see Steven T. Berry and Joel Waldfogel, Mergers, Station Entry, and Programming Variety in Radio Broadcasting, NBER Working Paper 7080, April 1999, forthcoming in the Quarterly Journal of Economics. These assessments are not necessarily in conflict with our results. There is probably a great deal of shifting of sub-formats that our relatively aggregated measure of format does not capture.

[^7]:    ${ }^{18}$ Standard \& Poor's has produced an electronic database of financial information on over 20,000 public companies for over more than 20 years. SIC denotes Standard Industrial Classification. This is a coding scheme for classifying firms according to industry as developed and maintained by the U.S. Department of Commerce. Since the Census is currently replacing the SIC system with the North American Industry Classification System (NAICS), we expect to be using NAICS in the future. Note that the data items obtained from the Compustat database are subject to revision, as Compustat updates its data.
    ${ }^{19}$ The 18 companies are identified in Appendix E. The number of owned stations and the percentage of radio industry revenues were calculated based on data in the BIA database, March 2001.
    ${ }^{20}$ S\&P chooses 500 of the largest publicly-traded companies which are intended to represent a broad index

[^8]:    ${ }^{21}$ Because financial ratios are typically ratios of dollars, they are unitless and are difficult to interpret except in comparison to some benchmark ratio. Consequently the choice of a benchmark is an important choice in financial analysis.

[^9]:    ${ }^{22}$ Typically, when analysts refer to movements in the stock market, they use information on movement in the stock prices of the S\&P 500 companies. Thus, the S\&P 500 represents firms doing business in just about every segment of private enterprise.
    ${ }^{23}$ Compustat calculates the EBIT margin as (((sales + other income) - (cost of goods sold + selling, general, and administrative expense + depreciation and amortization) $) /($ sales + other income) $) \times 100$.

[^10]:    ${ }^{24}$ Short-term debt tends to be indicative of a firm's working capital policies, not its long-term financing policies.

[^11]:    ${ }^{25}$ Recent research suggests that firms with a higher percentage of debt tend to charge higher prices and compete less vigorously than firms with a lower percentage of debt. See Judith A. Chevalier, "Capital Structure and Product-Market Competition: Empirical Evidence from the Supermarket Industry," American Economic Review 85: 415-435; Judith A. Chevalier, "Do LBO Supermarkets Charge More? An Empirical Analysis of the Effects of LBOs on Supermarket Pricing," Journal of Finance 50: 1095-1110. Further, research also suggests that an industry's general level of leverage is an indicator of its greater concentration and potentially less vigorous competition. See, for example, Gordon M. Phillips, "Increased Debt and Industry Product Markets: An Empirical Analysis," Journal of Financial Economics 37: 189-238. See also the "q-ratio" analysis of assessing competition in video programming distribution markets in Implementation of Section 19 of the 1992 Cable Act (Annual Assessment of the Status of Competition in the Market for the Delivery of Video Programming), CS Docket No. 94-48, First Report, Appendix H, 9 FCC Rcd 7442 (1994).

    ${ }^{27}$ E. Lindenberg and S. Ross, "Tobin's q Ratio and Industrial Organization," Journal of Business 54: 1-32. W. Marshall, "Tobin's q and the Structure-Performance Relationship," American Economic Review 74: 1051-1060. Additionally, the difficulty of new entry and the weakness of substitutes for radio advertising further indicate a lack of perfect competition.
    ${ }^{28}$ Specifically, this ratio is computed as follows: ([\{ending share price + dividends per share \}/ \{beginning share price $\}]-1$ ) x 100 , which is equal to price appreciation plus dividend yield.
